

Product Description

WaveCopy is an automated file organization tool, designed to copy items from a source directory, or sub-directory to a destination directory specified by the user. WaveCopy has four main operating modes which are selected via command line parameter, these modes include:

- Copy all files
- Copy all sub-directories
- Copy all files of a certain extension
- Copy all COMTRADE files that comply with the COMNAME standard

For all four operating modes WaveCopy is designed to never copy the same file twice, as it always keeps track of the time the latest file was created from each directory the application has copied files from.

While using the operating mode “copy all COMTRADE files that comply with the COMNAME standard” the application will create and update a list of stations where the files were created, and the latest file time from each station. This list will be used to ensure that the latest files from each station are never left uncollected, due to the devices in separate stations not being time synced.

Example Station List:

	A	B	C
1	Station1	07/06/20 01:05:37.116	
2	Station2	07/06/20 01:31:52.083
